

NETWORK CONSULTING

A network, by definition, is when two or more computers are connected through a series of cables, radio signals and/or hardware. In most business environments there are more than two computers that are required to communicate with each other. Each additional computer that is added to the network increases its complexity. Your network is serving as an information backbone for your business, so careful planning and meticulous execution must be practiced to keep performance optimized.

LIHQ provides quality network and computer services to small and medium sized businesses. From technology upgrades, to vendor selection, to custom solution development and management, LIHQ can help you decide just what is right for your business.

The following are examples of some of the technologies we specialize in:

Operating Systems:

Microsoft Windows® Server-Based Networks

UNIX/AIX/Linux Server-Based Networks

Network Services:

Copper and fiber optic network cabling

Networked attached printers, scanners and other peripherals
